

Fuel supply: Hitachi Astemo knows the system!

When considering products for the supply of fuel, Hitachi Astemo as a well-known supplier to both the OEM and IAM environment considers all components of the fuel system.

Starting in the tank with the fuel feed unit, pump or the sensor for the fuel supply, we continue with the high-pressure pump and finally also with the fuel injectors. In order to provide our customers with the very latest technology, we also have started with our own manufacturing of control units for fuel pumps (PEM - Pump Electronic Module).

FUEL FEED UNITS

With a large range of fuel feed units, pumps and level senders, products for the fuel supply system are one of the fastest growing product areas of Hitachi Astemo. With over 350 products, we already cover over 120 million vehicles in the EMEA region. With a market coverage of over 60%, this makes us the top supplier for this category.

CONTROL UNITS

With our PEM's (Pump Electronic Modules) from our own production, we are currently concentrating on vehicles from the VW Group. Currently, we already cover over 15 million vehicles with our program.

HIGH PRESSURE PUMP

For over 20 years, Hitachi has been present in the original equipment market with high-pressure pumps (HPP's) „Made in Germany“. With our portfolio we already cover over 14 million vehicles in Europe. With the current program expansions, we will be represented in original equipment for years to come, including the last generation GDI engines of well-known European OEMs. Matching camshaft followers and seals required for service or maintenance are also available from us.

Fuel supply products play an important role for Hitachi Astemo, but we have much more to offer! Visit our website to find out more details!
